

## 10. Retrofit from IEPLC-3

Even if IEPLC-3 will still be supported we encourage people who needs to modify an existing IEPLC-3 document to take the time to move it from IEPLC-3 to SILECS.

In order to simplify this operation an automatic retrofit procedure has been put in place.

### Retrofit a IEPLC-3 class document

In order to retrofit an IEPLC-3 class press: File->Import->Silecs->Import IEPLC-3 Design.

Enter Name and version of the IEPLC-3 Class and press Next. The following window will allow you to change the Design name while importing it into SILECS.

The version must be changed because SILECS uses a Major.Minor.Patch convention ([more information](#)). Press Finish and the SILECS Document will be automatically created.

### Retrofit an IEPLC-3 mapping document

In order to retrofit a IEPLC-3 mapping press: File->Import->Silecs->Import IEPLC-3 Deploy.

Enter Name of the IEPLC-3 controller and press Next. The new deploy document supports multiple controllers so you are requested to choose the new SILECS Deploy project name and version.

Press Finish and the SILECS Document will be automatically created.

**NB:** If you have multiple identical IEPLC-3 deploy (only host-name changes) migrate only one of them and add all the other controllers under the Deploy-Instances node.
